

FOR BUSINESSES AND ORGANIZATIONS

FIVE SIMPLE CHECKS

Start with one page. Find one barrier. Make one task easier.

Digital accessibility means designing websites, applications, documents, and online content so that people with disabilities can perceive, understand, navigate, and interact with them independently.

For many people, a website is the first or only way to find information, schedule an appointment, purchase a product, complete a form, or request support.

A missing label, uncaptioned video, or mouse-only button can stop someone from completing an important task. Correcting even one barrier can make a real difference.

- People who are blind or have low vision
- People who are Deaf or hard of hearing
- People with motor disabilities
- People with cognitive or learning disabilities
- People using screen readers, voice control, switches, or other assistive technology
- People with temporary or situational limitations

The five checks are a practical starting point, not a complete audit or certification. The goal is whether real people can find, understand, navigate, and complete what they came to do.

ACCESSIBILITY HELPS PEOPLE PERCEIVE, UNDERSTAND, NAVIGATE, AND INTERACT.

CAN PEOPLE PERCEIVE YOUR CONTENT?

01

COLOR CONTRAST

The barrier: Low contrast can make text difficult to read, especially light-gray text on white, text over a photograph, or faint button labels.

Try this: Review navigation, buttons, and forms. Test any combination that appears faint, including hover, focus, and disabled states.

Avoid low contrast

Example to avoid

Clear text

Easier to distinguish

02

ALTERNATIVE TEXT

Write concise text that explains the image's purpose. If the image disappeared, would the page still make sense?

AVOID

"image123.jpg"

BETTER ALT TEXT

Designer adds a concise description of a mountain landscape shown on a webpage.

Decorative image? Use empty alternative text so assistive technology skips it.

03

CAPTIONS

Captions turn speech and important sounds into readable text.

SOUND-OFF CHECK

Can someone still understand the message?

- Captions are accurate and synchronized.
- Names and technical terms are corrected.
- Important sounds are included.

CAN PEOPLE NAVIGATE AND COMPLETE TASKS?

04

KEYBOARD ACCESSIBILITY

Put the mouse aside. Can every important control be reached, operated, and exited?

Tab

Shift + Tab

Enter

Space

Arrow keys

FIVE QUESTIONS

- Can every important control be reached?
- Is the selected element visibly highlighted?
- Does the navigation order make sense?
- Can menus and pop-ups be opened and closed?
- Can you move without becoming trapped?

Who may be affected: People with motor disabilities, people who cannot use a mouse, and many screen-reader users rely on keyboard navigation or similar commands.

05

LABEL FORM FIELDS

Every field needs a visible name that remains on screen while someone types.

A LABEL THAT STAYS VISIBLE

Full name

Dhanvin Ganeshkumar

Email address

name@example.com

Appointment date

MM / DD / YYYY

Schedule appointment

WHAT A LABEL DOES

NAME THE FIELD

Use a visible label such as "Email address." It should remain visible after someone starts typing.

 USE / EMAIL ADDRESS

 AVOID / TYPE HERE

MAKE BUTTONS SPECIFIC

Use "Schedule appointment," not "Submit." The button should explain what happens next.

QUICK CHECK

Can every field and button be understood without guessing?

FIRST STEP / RECORD WHAT FAILED

Note the page address, control or field name, and exactly what happened. Send it to the person responsible for the website.

PASS WHEN / THE TASK WORKS

A person can reach the control, see where focus is, understand the label, activate the action, and move on without becoming trapped.

A TEN-MINUTE ACCESSIBILITY CHECK

10

MINUTES / ONE PAGE

1. Important text is easy to distinguish from its background.
2. Text remains readable and usable at 200% zoom.
3. Important images have meaningful text alternatives.
4. Videos include accurate captions.
5. Important controls can be reached using only a keyboard.
6. The selected keyboard element is visibly highlighted.
7. Form fields have permanent, understandable labels.
8. Buttons explain what they will do.
9. Links make sense without surrounding text such as "click here."
10. Instructions do not rely only on color, sound, shape, or position.

IF YOU IDENTIFY A BARRIER

FIND IT. DESCRIBE IT. FIX IT. RECHECK IT.

- | | | |
|---|--|--|
| <div>01</div> RECORD
Save the page address. | <div>02</div> DESCRIBE
Name the element and problem. | <div>03</div> CAPTURE
Add a screenshot if useful. |
| <div>04</div> IMPACT
Note who and what task are affected. | <div>05</div> SEND
Share it with the site owner. | <div>06</div> RECHECK
Test again after the update. |

ONE IMPROVEMENT IS A MEANINGFUL START

Accessibility is ongoing. Start with one important page or one common barrier, then improve and recheck.

RESOURCE NOTE

Educational resource only - not an audit, certification, guarantee of conformance, or legal determination.
